HOW SHOT ARE MADE.

And Why the Pure Lead Has to Be Tempered With Tin.

The manufacture of shot, described by O. C. Horn in Forest and Stream, requires a high tower, a perforated pan, a tank of water and "tempered" lead.

Shot are made by dropping molten lead from a high point to the earth. The lead forms into globules, just as the raindrops do when they fall from the clouds. Ordinarily we do not realize that raindrops are little spheres, but under the proper conditions they freeze, and we have hailstones, which may be called shot made of ice.

In the making of shot pure lead is melted and mixed with a "temper" that consists mainly of tin, and then poured into a perforated pan or sieve. The perforations vary according to the size of the shot to be made.

A temper is mixed with the lead in order to make the globules form when the lead falls. If pure lead were used it would fall in the form of little bars instead of round shot.

In order that the globules may have plenty of time to form the lead must fall a long distance, and so towers are built. The towers used to be made as high as 200 feet and even more, but modern towers are rarely over 150 feet.

The perforated pan into which the molten lead is poured is at the top of the tower, and the globules of lead fall through the perforations into tanks of water at the bottom of the tower. The water cools them and also prevents them from flattening out, as they would if they fell on a solid floor.

From the water the shot go to steam driers. After drying the perfect shot are separated from the imperfect by means of glass tables inclined enough so that the shot when poured on at one end of the table, will roll to the other end. At the further end of the table are two gutters side by side. The imperfect shot roll slowly and with difficulty, so that they have not enough momentum to carry them beyond the first gutter. The perfectly round shot roll easily and swiftly, and when they reach the foot of the table they jump nimbly across the first gutter and land in the second.

After separation the perfect shot are polished by rolling in plumbago, and workmen then put them in bags for shipment or send them direct to the cartridge filling department to be loaded into shells.

A House Party.

Willie—Paw, what is a house party?
Paw—A real estate man, my son.—Clayton's Enquirer.

The Acorn.

Take a large acorn, suspend it by a thread so as to nearly touch the water in any glass vessel, set it upon your mantelshelf, bracket or table and let it stand there for about two months without in any way interfering with it excepting to supply fresh water. The acorn will burst, throw a root down into the water and a stem upward, sending out from the stem beautiful green leaves.

Precaution.

"Why did you insist on having your new servant arrive on Saturday?" asked the neighbor.

"There's no train back till Monday," replied Mrs. Crossroads. "We wanted to be sure of having help for our Sunday dinner."—Washington Star.
